Interfacing with other systems

Redkite Systems is aware that many of our customers have many 'back-office' and front line systems that can benefit from an interchange of information with modules from Redkite Systems.

To facilitate this requirement our systems contain specialist customisable import and export interfaces many of which can be automated, if required.

HR Systems

Using a combination of the import and export functions available Redkite Systems can exchange information with most HR systems. We are happy to discuss further information exchange or integration, as required.

Personnel details import

Redkite Tracker can accept information held in a standard .csv file for import into the Redkite Personnel Development System.

As well as personal details the import handles changes to location, status and role and can accommodate personnel who have more than one role within your organisation.

Training Courses

The Redkite Course Management System can create courses and multiple instances of courses targeted at generic or specific audiences from MS Excel or similar

Training Records

Redkite Tracker can accept both historical and current training records for staff who have undertaken training and whose records have been updated in systems other than Tracker.

Records can be imported from external e-learning systems.

Import Templates

The structure for importing information into a Redkite system is documented in the relevant User Guide.

Equipment

Redkite Systems can convert data held in a number of Equipment Management Systems.

Where information is converted, it is usually possible to retain any bar code / RFID tagging in which you will have previously invested. This can greatly reduce the time and cost of moving into a new electronic recording system.

Test Results

Tests results can be imported into the Redkite AMS Core module. This is ideal for PAT testing or where tests are undertaken by external agencies such as insurance companies.

Mobilisation - Equipment

Equipment availability can be exported to external mobilisation systems.

Mobilisation - People

Redkite Tracker can be supplied with an interface to export pre-defined skills to external systems.

The requirement was designed to interface to duty management systems but the information can be uploaded by any system.

Tracker exports the current status of competence for each pre-defined skill area. The file is modified after each skills update on the Tracker system.

Bar code readers

Most bar code readers with a web browser are supported. Please check BEFORE purchasing.
